PHYSICAL SECURITY GUIDANCE

FOR THE FOOD AND BEVERAGE

INDUSTRY TO ENHANCE FOOD DEFENSE OUTCOMES

INSTALLMENT #1 – NOVEMBER 2021

11 Founded in 1955, ASIS International is a global community of security professionals, educators, and
12 practitioners, all of whom has a role in the protection of assets - people, property, and/or information.

13
14 Our members represent virtually every industry in the public and private sectors, and organizations of all
15 sizes. From entry-level managers to Chief Security Officers (CSOs) to CEOs, from security veterans to
16 consultants and those transitioning from law enforcement or the military, the ASIS community is global and
17 diverse.

18
19 The following members of the ASIS Community tirelessly volunteered their time to produce this guidance
20 document for the global food and beverage manufacturing committee:

21

Name	Company	Contact Information
Rich Widup	Reckitt	richard.widupjr@mjn.com
Jason Bashura	PepsiCo	jason.bashura@pepsico.com

DRAFT

Scope and Introduction

Food and Beverage Threats

There are several threats to the food and beverage industry and while the threats may originate from external sources, there is a far greater likelihood that threats will originate from insiders. A model which was developed to address workplace violence offenders can also be applied to the food and beverage industry to illuminate the most likely insider sources.

Type	Description	Potential Motivation
1	Criminal Intent, Outsider	Behavioral Health Patient Social Media Fame Seeker Copycat Extortion Economic motivation
2	Truck Driver	My load isn't ready, you are costing me money
3	Current/Former Employee or Contractor	I am upset with a coworker and adulterate to create problems for that person * I am upset with the company and adulterate as retribution and to harm the brand * Youthful stupidity I am not paid enough *
4	Domestic or intimate partner driven	I am upset with a coworker and adulterate to create problems for that person
5	Ideological	Radicalized Insider, terroristic intent, wide scale public health impact

* - Supported by actual incidents

Internal threat sources represent the greatest potential risk to food and beverage enterprise; therefore this document has organized to address the most sensitive internal areas and work outwards toward the perimeter; whether that be the building or perimeter fence.

External Threat Sources include individuals who have no direct relationship with the business who may be motivated by terrorists (human and cyber), extremists with radical ideologies, or “value-driven” groups who feel justified by their beliefs.

Identifying Risk

Food defense is the effort to protect food and beverage products from acts of contamination and adulteration where there is an intent to cause harm to consumers, or as an act of revenge or in response to a grievance against an individual or the company. In the United States, the Food Safety Modernization Action (FSMA) Final Rule for Mitigation Strategies to Protect Food Against Intentional Adulteration, establishes a framework for regulated facilities which largely covers the Type 5 ideological offender which attempts to solve for some of the risk in the form of “wide-scale public health impact”. This document is intended to serve an international audience, organizations of all sizes and provide guidance for protecting food and beverage operations from all insider threats.

108
109
110
111
112
113
114
115
116

Regardless of where the facility is located, it is in the best interests of food and beverage facilities (hereafter facilities) to identify and reduce the risk of acts of intentional adulteration (hereafter contamination). Facilities should closely evaluate and assess internal and external threat sources and resulting risk accordingly.

This document is not intended to teach organizations how to conduct a detailed risk assessment for facilities, but rather provide clarity on the difference between a vulnerability and a risk assessment. The common elements of a food defense risk assessment a team may follow are described below:

Step	Description
1. Asset Characterization	Asset characterization includes analyzing information that describes technical details of production processes required to support analysis, identifying critical assets, identifying hazards and consequences of contamination, and identifying existing layers of protection.
2. Threat Assessment	Consideration of human hazards should include internal threats, external threats, and internally assisted threats (e.g., collusion between insiders and outsiders). The selection of the threats should include historical incident history in the food and beverage industry, reasonable local, regional, or national intelligence information, where available.
3. Vulnerability Identification	Determining where product may be susceptible to contamination.
4. Risk Analysis	The risk assessment determines the relative degree of risk to the facility in terms of the expected effect of various product contamination scenarios as a function of consequence and probability of occurrence.
5. Mitigation Identification and Food Defense Master Planning	The team will brainstorm options for reducing the vulnerability to high risk contamination scenarios identified in the process. Mitigation strategies should be prioritized and presented to facility leadership for consideration and implementation.
6. Update the Food Defense Plan	As additional mitigation strategies are implemented, the food defense plan should be updated and additional training provided as appropriate.
7. Reanalysis and Reassessment	Risk should be reassessed periodically, at leadership request, as a result of an incident or when any significant changes are made to the facility or process.

117
118
119
120
121

As the risk assessment is being conducted this document can be used to consider strategies that will decrease the likelihood that an adversary can successfully contaminate a product, increase deterrence and more quickly detect violations of food defense measures.

122
123
124
125
126
127
128
129

Document Assumptions and Limitations

- This document is intended to reduce the risk of product contamination. Its scope is limited to production processes and ends when the product is in tamper evident packaging.
- Food defense in the context of this document extends beyond wide scale public health impact and the radicalized insider.

130
131

Identification and Protection of Vulnerable Areas

132
133

Labs

134
135
136
137
138
139
140

From a product contamination perspective, a lab may contain reagents and other materials (that could be used as a contaminant) that are legitimately needed to support operations. Such materials must be protected from unauthorized access by a person intending on contaminating food or beverage production. Further, sound inventory control programs are another “layer” of protection assuring that these materials cannot be used for an act of contamination.

141
142
143
144
145
146
147

Physical security and access control measures for labs should be considered and implemented based on site-specific risk assessment. This may vary by site and depends on the lab’s location in the facility. Common security measures might include electronic access control to manage entry, lock and key control, cameras, door alarms, door logs, additional supervision, container security (e.g., locked and potentially alarmed chemical storage), color-coded uniforms or bump caps to designate work area, and limiting personal items in the lab.

148
149
150
151
152
153
154

Fail-secure electronic locksets may be specified in lab situations to prevent unauthorized access to the facility if primary and backup power is lost. A fail-secure system requires power to unlock the door thus preventing circumventing of the security system by cutting power. Fail-secure locksets typically include key override to allow access by appropriate personnel in power outages. A door position switch can monitor door position for a variety of purposes and notify security personnel if it detects a door has been physically forced open or held open beyond the permissible time set in the software (e.g., 30 seconds).

155
156
157
158
159
160

Security cameras are desirable in lab settings. These observation cameras can be an important safety and security feature especially in high-security labs where windows are undesirable. Many different camera types may be employed depending on the function. Security cameras typically are installed with a fixed field of view pointing directly at the item or area that is being monitored, (e.g., a lab entrance, freezer with sensitive samples).

161
162
163
164
165
166

Additional lab security measures should include maintaining a strict inventory and training. Appropriate personnel should always know where and how much hazardous materials are stored in the lab. Unaccounted loss of these materials should be reported immediately to security personnel and thoroughly investigated to determine the root cause and to determine if product has been impacted. Lab personnel should be appropriately trained on lab security procedures and why they are important.

167 Finally, lab personnel should have basic or general food defense awareness training that can support and drive
168 future success of the site's food defense program.

169

170 **Mixing and Weighing Areas**

171

172 Mixing and weighing rooms are potentially vulnerable areas where a substance could be introduced to
173 contaminate food products. The substance could be evenly mixed within the product and affect all the
174 servings producing a contaminated batch. Attacks in these settings would likely be an insider. Therefore, it is
175 critical facilities implement effective mitigation strategies to reduce the vulnerabilities that might be present in
176 these areas.

177

178 Facilities should conduct site-specific risk assessment to learn of vulnerabilities unique to the site. Risk
179 assessments should be periodically revisited and modified as necessary; typically, on a 3–5-year recurring
180 cycle, or when on site conditions, staff load, or other factors within the facility change that could impact the
181 outcomes of the previously completed risk assessment.

182

183 In 2011, the FDA released the Food Defense Mitigation Strategies Database available for public use at
184 <https://www.cfsanappsexternal.fda.gov/scripts/fooddefensemitemitigationstrategies/index.cfm>. The Food
185 Defense Mitigation Strategies Database (hereafter FDA Database) contains an extensive listing of mitigation
186 measures that may be useful in reducing contamination vulnerabilities that might exist in the facility's
187 operations. The FDA Database can be browsed by categories (e.g., conveyance, material handling, packaging,
188 processing, key activity types, storage, transportation/distribution). Another way to classify mitigation
189 strategies might be:

190

- 191 • Physical and technical; and
- 192 • Procedural or administrative
- 193 • Personnel based

194

195 Physical security and access control measures should be implemented and based on site-specific risk
196 assessments. This may vary by site and depends on the production process point, but may include as
197 feasible, segregated weighing and mixing areas with electronic access control to manage entry, lock and key
198 control, cameras, door alarms, door logs, additional supervision, container security (e.g., locked partial
199 ingredient storage), color-coded uniforms or bump caps to designate work area, and limiting personal items.
200 This typically would include increasing the visibility of commodities during production and training the
201 personnel to be aware of suspicious activity.

202

203 Other security measures which may help reduce vulnerability in mixing and weighing areas can include the
204 following:

205

- 206 • There are significant inherent characteristics that would make access to the product very difficult
207 (e.g., enclosed systems, pressurized equipment, railings, equipment safety features, or shields).
- 208 • The mixing or weighing process is under constant observation, or the view of the step is unobscured,
209 preventing an inside attacker from adding a contaminant without being detected.
- 210 • There are numerous workers in the immediate area that would notice a contamination attempt by an
211 inside attacker.
- 212 • It is extremely likely the inside attacker would be detected adding a contaminant to the food due to
213 the need to conduct highly irregular or suspicious activities to contaminate the food; successful
214 introduction of a contaminant at this point would be extremely difficult or impossible.

- 215 ● Multiple workers are required to be present for the mixing or weighing procedure to function.
- 216 ● Product is moving at a high rate of speed.
- 217 ● Product is handled, staged, or moved in an inaccessible manner (e.g., bucket conveyors being moved
- 218 via elevated track)
- 219 ● These areas are staffed by permanent employees.
- 220 ● All staff are instructed to systematically and immediately report any anomaly, unusual incident or
- 221 behavior to their supervisor.
- 222 ● Clear operating rules are defined in these areas.
- 223 ● Access to change any sensitive parameter (e.g., access to recipes/formulae, key production
- 224 parameters, release of products) and remote access (by supplier or operator) are secured by
- 225 usernames and passwords.
- 226 ● Tamperproof locking/sealing systems on ingredients or raw & direct food contact material
- 227 containers, gases are systematically checked. Records are available. Corrective actions are taken in
- 228 case of deviation.
- 229

230 Finally, operations personnel that work in the vicinity of the mixer/blending areas should have basic or
 231 general food defense awareness training that can support and drive future success of the site’s food defense
 232 program.

233
 234 **Conveyance**

235
 236 Coming soon.

237
 238
 239 **Batch Tanks**

240
 241 Coming soon.

242
 243 **Bulk Liquid Receiving / Storage**

244
 245 Coming soon

246
 247 **Ice/Water Processing Areas**

248
 249 Water is a critical element in most food and beverage manufacturing scenarios. As such, ice/water systems
 250 need to be secured as a critical part of the infrastructure. Examples of best practices include

- 251
- 252 ● Restricting access to waters wells by lock or other access control methods.
- 253 ● Restricting access to water storage tanks via locked ladder guards or locked tank hatches.
- 254 ● Restricting access to water treatment systems and water softening processes where direct access to
- 255 the water stream is a possible source of the introduction of a contaminant. .
- 256 ● Establishing written agreements with water suppliers to notify the company immediately whenever
- 257 they determine that the water supply has become unfit for use.
- 258
- 259

260 **Bulk liquid receiving**

261

262 Coming soon.

263

264 **Liquid Storage**

265

266 Liquid storage is a potentially vulnerable point for contamination. A contaminant added to a liquid storage
267 tank could result in the blending of that contaminant into a product undetected. As such, liquid storage tanks
268 need to be secured. Examples of best practices include

269

270 • Restricting access to liquid storage tanks via locked ladder guards or locked tank hatches.

271 • Alarming hatches so facility personnel are notified when there is access to a storage tank.

272

273 **Finished product conveyance**

274

275 Coming soon.

276

277

DRAFT

Important Procedural Matters

Visitor Management

Approval for visitors to access the facility should be obtained at least twenty-four hours in advance or at a minimum approved by a host. Visitors to the site should have to provide some form of official photo identification to validate identity. Ideally, visitors should enter via a separate entrance such that their movement and degree of access is limited controlled until being met by the host or escort. Visitors should always be escorted and only allowed access to areas where official business is conducted.

Whenever possible and not in contradiction to safety or good manufacturing practices (GMP), visitors should wear some form of identification which easily denotes their visitor status. This could include a uniquely colored bump cap or color-coded vest indicating visitor status. Visitors should not generally be allowed into any area where manufacturing, products or ingredients are stored. A log should be maintained for no less than 60 days which contains information regarding the name of the visitor, the associated firm, the name of the escort(s)¹, areas visited and the time of their arrival and departure. An example of a visitor control log can be found in Appendix 1.

Truck Driver Management

Like visitors, truck driver access to the facility should be highly controlled. Truck drivers should not be allowed to enter any area of the facility where products or ingredients are manufactured or stored. When access to the facility is necessary to facilitate delivery or pickup of products, truck drivers should only be allowed to access the shipping or receiving area of the facility. Under no circumstances should truck drivers be allowed on the loading dock area, the manufacturing area or the storage area for products and ingredients.

Truck drivers may be instructed to stay in their cab during the unloading and loading process. Facilities might consider exterior portable toilets for truck drivers. Alternatively, sites may wish to provide a lounge for truck drivers. This lounge should be highly controlled to ensure that the drivers cannot access any other part of the facility.

Truck drivers should not apply or remove seals from trailers. Seals should be applied or removed by facility or security personnel. An example of seals management procedure can be found in Appendix 2.

A written or electronic log of truck drivers should be maintained for a period of not less than 60 days. This log should contain information regarding the name of the driver, the date and time when the driver accessed and departed the facility, and the name of the driver's employer.

Contractors/Temporary/Contingent Workers

Facilities should ensure that contractors who are "routine" or who frequently visit the site undergo a background screening process in line with personnel surety protocols for employees.

¹ For food defense plan record keeping purposes, monitoring and verification of escort practices.

321 Access to area(s) of the facility by contractors should be tightly controlled such that access is limited only to
322 those areas needed to perform assigned tasks. When contractors will be performing work on site,
323 consideration may be given to advising employees and supervisory personnel as to the nature, duration and
324 location of the work.

325
326 Any access control badges and/or keys which are provided to contractors should be collected each day before
327 departing the facility. Badges issued to contractors should be of a different design and/or color than those
328 issued to employees or visitors.
329

330 **Management and Storage of Partial Ingredients**

331
332 In most cases, ingredients are received and stored in tamper evident packaging which allows for facility
333 employees to detect tampering and contamination. However, in some cases, partial ingredient packaging may
334 be present at a facility, and this is a potential point of vulnerability to contamination. Potential strategies to
335 reduce the risk of contamination via partial ingredients include:

- 336
- 337 • Storage of partial ingredients in tamper evident containers (e.g., use of bins with numbered seals)
 - 338 • Securing partial ingredients in locked storage
 - 339 • Weighing partial ingredients returned to inventory and reweighing when next brought to mixing,
340 weighing or staging steps in the production process

341
342 Finally, ingredient handlers should have basic or general food defense awareness training that can support and
343 drive future success of the site's food defense program.
344

345 **Hazardous Materials and Chemical Storage**

346
347 From a product contamination perspective, a facility will likely contain non-food grade cleaning, sanitizing
348 and facility equipment maintenance materials (that could be used as a contaminant) that are legitimately
349 needed to support operations. Like lab security, cleaning and non-food grade materials must be protected
350 from unauthorized access by a person intending on product contamination. Further, sound inventory control
351 programs are another "layer" of protection assuring that these materials cannot be used for an act of
352 contamination.

353
354 Physical security and access control measures for chemical and cleaning storage should be considered and
355 implemented based on site-specific risk assessment. This may vary by site and depends on the lab's location
356 in the facility. Common security measures might include electronic access control to manage entry, lock and
357 key control, cameras, door alarms, door logs, additional supervision, container security (e.g., locked and
358 potentially alarmed chemical storage), color-coded uniforms or bump caps to designate work area.

359
360 Fail-secure electronic locksets may be specified in non-food grade material storage situations to prevent
361 unauthorized access to the facility if primary and backup power is lost. A fail-secure system requires power to
362 unlock the door thus preventing circumventing of the security system by cutting power. Fail-secure locksets
363 typically include key override to allow access by appropriate personnel in power outages. A door position
364 switch can monitor door position for a variety of purposes and notify security personnel if it detects a door
365 has been physically forced open or held open beyond the permissible time set in the software (e.g., 30
366 seconds).
367

368 Additional security measure should include maintaining a strict inventory and training. Appropriate
369 personnel should always know where and how much hazardous materials are stored. Unaccounted loss of
370 these materials should be reported immediately to security personnel and thoroughly investigated to
371 determine the root cause and to determine if product has been impacted. Maintenance and sanitizing
372 Personnel should be appropriately trained on security procedures and why they are important.

373
374 Non-food grade materials should never be left unattended in a production area and should be properly
375 secured when not in use.

376
377 Finally, maintenance and sanitizing personnel should have basic or general food defense awareness training
378 that can support and drive future success of the site's food defense program.

379

380 **Restricting Personal Effects/Property from Production Areas**

381

382 Coming Soon

383

384 **Tamper Evident Solutions**

385

386 Many manufacturers are required to develop and implement solutions for their products which meet the
387 tamper-resistant standards as established by the governing regulatory agency. These solutions are intended to
388 assure that the product's packaging can be reasonably be expected to provide visible evidence to consumers
389 that tampering has occurred.

390

391 Tamper evident packaging on the other hand, is packaging which contains an indicator or barrier to entry
392 which, if breached or missing, can be reasonably be expected to provide visible or audible evidence that
393 tampering has occurred.

394

395 These solutions are important not just for final products, but also certain raw materials and other materials
396 which are being blended during the manufacturing process. Implementation of these efforts reduces the
397 possibility of intentional tampering/ adulteration.

398

399 **Incoming Shipments**

400

401 All trucks and trailers with supplies, raw materials, or finished goods must be sealed until use. If the seal must
402 be removed for inspection, a new seal is applied and documented.

403

404 Unloading of vehicles transporting raw materials, finished products, ingredients or other materials used in
405 food processing must be closely supervised. All supervisors must be trained in food defense procedures
406 related to shipping and receiving.

407

408 Other than LTL and courier shipments, loading and unloading activities will be scheduled and/or monitored
409 and only scheduled shipments will be accepted. Unscheduled or unauthorized shipments are held until
410 authorization is obtained.

411

412 Only authorized personnel will be allowed access to the loading dock area.

413

414 Seals must be verified BEFORE the load is accepted.

415

416
417
418
419
420
421
422
423
424
425

Suppliers and Vendors

The risks associated with product tampering and intentional adulteration extend to suppliers of all products. As such, it is important that manufacturers know who they perform business with in order to ensure that a similar level of food defense planning is operational at those facilities as it is at the facility which manufacturers the final product. As such, consideration should be given to conducting security assessments of key product/packaging/raw material suppliers and vendors.

426
427

Physical and Technical Security

428
429

Perimeter Barriers

430
431
432

If a facility chooses to employ perimeter fencing, the following performance standards should be considered. Perimeter fencing is not a requirement of a food defense program.

433
434
435
436
437
438
439
440
441
442
443
444
445
446

Chain-link fencing should be at least 6 feet in height, excluding the anti-personnel climb guard. The fabric should be at least 9-gauge wire. This fencing should be galvanized with mesh openings not larger than 2 inches per side and have twisted selvages at the top and bottom. The wire should be taut and securely fastened to rigid metal or reinforced-concrete posts set in concrete. These posts should be evenly spaced to maintain fence tautness and strength. The top and bottom of the fence should contain a tension wire that runs horizontally along the entire fence line to help retain the integrity of the fence. The fencing must reach within two inches of hard ground or pavement. On soft ground consider extending below the surface to compensate for shifting soil or sand. Fencing would typically include a "top-guard" which is constructed of at least three strands of barbed wire placed at a 45-degree overhang that faces away from the property. The top guard should be continuous and not be omitted from vehicle or pedestrian gates. Top guard may need to be mounted vertically on such gates.

Walls should be at least 7 feet in height

447
448

Gates

449
450
451
452
453
454
455

Gates are the only moveable part of a fence and therefore should be properly constructed with appropriate fittings to ensure that vehicular or pedestrian access is controlled. Most vehicle gates are cantilever slide-like gates. Smaller gates limit the potential for vehicle piggybacking and can be closed quickly.

When employing pedestrian gates consideration of an access controlled self-closing mechanism is encouraged to prevent the gate from being left open.

456

457 Access Control

458

459 Access control is the process of restricting and/or controlling entry onto a property, a building, room, or
460 other areas by means of physical barriers, key control, biometric/card pass systems or other electronic
461 devices.

462

463 Entry devices and access control SOPs should be implemented to monitor and control access of authorized
464 personnel and property into and out of locations while denying access to unauthorized persons. It is
465 important that access control programs be properly managed to ensure that access to a facility and areas
466 within the facility is granted by an individual with the appropriate level of authority to do so, access control
467 can be attained via any combination of barriers, gates, electronic security equipment, and/or guards that can
468 monitor and control entry and exit to a facility.

469

470 The objectives of an access control system are:

471

- 472 • To permit only authorized persons to enter the facility and select areas therein.
- 473 • To provide information to security personnel and/or site management for the assessment and
474 response to unauthorized entry or attempts
- 475 • To detect and prevent the entry of contraband (e.g., weapons, contaminants, GMP violations) and
476 • To provide an accurate accountability of who has accessed the facility/area.

477

478 Lock and Key Control

479

480 The most important element of lock of key selection is choosing a keyway that is not easily duplicated
481 without leadership approval. While there are limited product choices to meet this vital performance standard,
482 the failure to properly select the right system will invalidate all other key control measures commonly used
483 such as “DO NOT DUPLICATE” stamping, record keeping and audits. Ideally, each key should have a
484 unique and generic number stamped on the key head which indicates which locks are accessible and the
485 person to whom it is assigned. Designations such as “GM” for grand master should be avoided. A further
486 description of common terms and guidelines can be found below:

487

488 Grand Master key: a key that typically operates all locks on site:

- 489 • This key should only be given to specific employees with a need for such access upon approval of
490 Site Director and consistent with the facility’s policy.
- 491 • Keys should not be issued based on title, but rather by need.
- 492 • In the case of electronic access control in use at a facility, the use of keys on card reader equipped
493 doors should only be in an emergency.

494

495 Master Key: Typically, keys for multiple doors in a specific area.

- 496 • This key should only be given to specific employees with a need to access those areas.

497

498 Operating key: Typically, keys for office doors, work areas or specific locations.

- 499 • This key can only be given to specific employees with approval of the responsible person at that
500 location.

501

502 Incidental Keys: Keys specific to an individual’s workspace, (e.g., file cabinet keys, desk keys, safes)

503
504 All keys which are not issued should be stored in a secure location such as a locked container stored in an
505 office that is locked after business hours. Examples include a locked metal box stored inside a locked office,
506 or a lockable file cabinet inside a locked office.

507
508 Employees and select contractors can be issued keys. When issued, there should be a key control log
509 maintained which captures which keys were issued to what employee on what date as well as when the keys
510 were returned. The employee/contractor should sign for all keys which have been issued to verify receipt.
511 Refer to Appendix 3 for a sample key control log.

512
513 Like Access Control badges, all keys which were issued to an employee/contractor should be retrieved prior
514 to their off boarding. In the event a key is not recovered when a key holder separates from a company, a risk
515 assessment should be conducted to determine the need for rekeying impacted areas of a facility. Minimizing
516 key cylinders on the perimeter of a property and the perimeter of a building will reduce the likelihood of
517 having to undergo an expensive rekeying project.

518 519 **Video Surveillance**

520
521 Video surveillance is a system in which an image is transmitted to monitors/recording and control
522 equipment. Video surveillance should follow local legislation for both installation, signage, monitoring,
523 training, recording access.

524
525 Fixed cameras are typically preferred over Pan-Tilt-Zoom (PTZ) Cameras. Whenever possible, cameras
526 selected should provide the viewer with the ability to both monitor movement as well as identity. As an
527 example, a fixed camera with wide angle view may be used to cover more than one turnstile, lane of traffic, or
528 railroad track. In order to get facial recognition from a video image, the resolution needs to be at least forty
529 pixels per foot in the target area of the scene.

530
531 Use color, day-night transition cameras where lighting is too low to render a good color image in hours of
532 darkness.

533
534 15 frames per second might be considered for recording purposes or more where finer details may need to be
535 observed when viewing recorded video.

536
537 There is no standard for video retention in the industry however a typical range is between thirty to sixty
538 days. Retention for recorded video can vary by camera in an IP based system so careful consideration should
539 be made for each camera as to the typical time it might take to discover an incident and then set the retention
540 rates accordingly.

541
542 The strategy for camera deployment would typically involve access choke points (e.g., employee or vehicular
543 entry points) or fixed monitoring on critical asset areas. However, it is not uncommon to find video
544 surveillance cameras associated with the following areas:

- 545
546
- 547 • Car parks and lots used to store trailers and other equipment
 - 548 • Administrative Offices
 - 549 • Data Centers / IT Server Rooms
 - 550 • Refreshment Areas
 - Building exteriors

- 551 • The exterior and interior of loading dock areas
- 552 • The area where Quality Control testing is performed
- 553 • Dispensing and mixing areas.
- 554 • Locations where labels, coupons and anti-fake stickers are stored
- 555 • Packing lines – recommend one at one at each end
- 556 • Returned / Damaged Goods areas
- 557 • Waste Processing Areas
- 558 • Other identified Critical Control/High Hygiene areas within the manufacturing areas
- 559 • Areas where controlled and/or listed chemicals are stored
- 560 • Area where hazardous materials are stored
- 561 • Perimeter fence

562
563 Cameras should only be deployed after a risk assessment and consistent with where video can have a
564 meaningful impact on risk reduction. Consider the use of an independent expert to help identify these needs
565 rather than a company that sells video equipment that may have a conflict of interest in any recommendations
566 made.

567

568 Intrusion Detection

569

570 Intrusion detection System (IDS) is a system that uses a sensor(s) to detect an impending or actual security
571 breach and to initiate an alarm or notification of the event. Alarm response can be managed internally, by a
572 3rd party alarm response firm or law enforcement. The primary objectives of an IDS are:

573

- 574 • Detect an actual or attempted intrusion into a protected space or removal of assets from a protected
575 space;
- 576 • Provide protection in depth to the facilities, buildings, assets, and operations to be protected,
577 enabling corrective assessment and response;
- 578 • Meet the needs of the application, integration with other physical security systems to provide
579 protection in depth;
- 580 • Facilitate security response by pinpointing where an intrusion has occurred and possibly where the
581 intruder has moved;

582

583 Strategies for the effective management of an IDS include:

584

- 585 • Train employees on the proper arming and disarming protocols to reduce nuisance alarms and costly
586 municipal charges
- 587 • Ensure employees know the protocols to follow in the event of an accident system activation
- 588 • Do not allow multiple persons to share a code
- 589 • Test the system regularly
- 590 • Ensure there is battery back up to sustain protection in a power outage
- 591 • Consider the need to enhanced monitoring and reporting which might include:
 - 592 ○ Failure to open
 - 593 ○ Failure to close
 - 594 ○ Monthly review of openings and closing
- 595 • Regularly update names and persons contacted in the event of an alarm activation.

- 596
- Do ask employees to respond to alarms alone. No facility entry should be made by anyone other than a law enforcement officer.
- 597
- 598

599 Personnel Identification Strategies

600

601 As previously mentioned, access to manufacturing, raw ingredient and product storage areas of the facility
602 must be highly controlled. In addition to access control procedures, consideration should be given to
603 developing mechanisms to visually identify the status of personnel on site. This can be accomplished by a
604 variety of means include color coding of access badges, clothing or bump caps.

605

606 Entry and Egress Openings

607

608 Keep pedestrian doors on the ground floor under surveillance (manned or otherwise) during working hours
609 and locked out of working hours.

610

- Consider installing card access or biometric access enabled turnstiles to confirm only authorized staff will enter.
 - Keep access to loading bays and delivery chambers closed except for deliveries and dispatching.
 - If kept open for ventilation (and this is typically not a recommended practice), avoid flimsy bug screens which can easily be breached by an unauthorized person by lifting the base or cutting through the screen mesh.
 - Secure all ground floor windows with bars or metal shutters where possible. Keep all windows closed unless someone is present in the room.
 - Improve the sturdiness of any roof openings (e.g., fanlight, vents) and ensure that they are alarmed/locked.
 - Keep roof access under video surveillance
- 611
- 612
- 613
- 614
- 615
- 616
- 617
- 618
- 619
- 620
- 621
- 622

623 Emergency Exits

624

- Keep emergency doors locked from the outside, free egress from the inside.
 - Remove all exterior hardware from emergency man doors.
 - Do not allow key cylinders to be installed on emergency exits and blank them out if they already are.
 - Emergency exits should be alarmed on a twenty-four-hour basis (not just when the IDS is armed) such that when opened an alarm is sent to a central receiving alarm monitoring station, either internal or external.
 - Consider the use of local audible alarms to deter the use of doors.
 - Consider the application of numbered seals as an added assurance that an exit door has not been used.

Personnel Surety

According to ASIS, “Employers from the largest to the smallest, understand the dual benefits of hiring the best people and providing a safe and secure workplace – both physically and financially – for their employees, customers, shareholders, and the community in which they operate. A key factor is to know as much as you can about the people you want to hire and to know that before hiring them. Hiring a new employee is an important responsibility for any organization. An employer who has performed a thorough preemployment background screening on its applicants is more likely to bring into the organization a highly skilled person who will prove to be a tremendous asset. Unfortunately, absent a sufficient pre-employment background screening, that same employer runs the risk of exposing his or her organization to someone who could ultimately become the organization’s greatest liability.” (ASIS International, GDL-PBS-2009, 2009, p. 1).

This is a critical mitigation strategy for the food and beverage industry given the preponderance of the threat is born from insiders. In essence, personnel surety is about ensuring trusted persons are in fact trustworthy. Background checks are almost universally addressed when one looks at various global models.

For example, as part of the FDA Food Safety Modernization Act (FSMA), the Food and Drug Administration (FDA) issued on May 27, 2016, a final rule to require domestic and foreign food facilities, with some exceptions, to address hazards that may be introduced to food with the intent to cause wide-scale harm to public health. These food facilities are required to identify significant vulnerabilities and take steps to minimize or prevent them. § 121.130 Vulnerability assessment to identify significant vulnerabilities and actionable process steps, subsection (b) states, “The assessment must consider the possibility of an inside attacker” (<https://www.ecfr.gov/current/title-21/chapter-I/subchapter-B/part-121>).

Another example can be found in the UK’s Food Standard Agency’s PAS 96: 217 “Guide to protecting and defending food and drink from deliberate attack” in section 2.9 which reads, “Personnel Security – procedures used to confirm an individual’s identity, qualifications, experience and right to work, and to monitor conduct as an employee or contractor.” The definition is footnoted with the following, “Personnel security principles are used to assure the trustworthiness of staff inside an organization but may be applied to the staff of suppliers within processes for vendor accreditation.” The document further goes onto discuss this topic by adding, “Personnel security guidance is used to mitigate the insider threat to the organization. Its principles can also be used by food businesses to judge whether key staff within the organizations that supply goods and services can be trusted to comply with specifications and procedures, and to work in the best interest of both the supplier and customer.

Insider attacks against the food supply aren’t limited to acts of terrorism and can be perpetrated by employees, contractors or suppliers, essentially anyone with access to the facility; therefore, it is critical for every organization to improve its ability to identify an inside attacker.

The following is a list of generally accepted means by which personnel surety or security for candidates and on an ongoing basis with insiders might be achieved through the following verification activities:

- New Hires
 - Identity
 - Eligibility to work in the host country

- 683 ○ Qualifications, experience and past performance
- 684 ○ Establishing and monitoring to ensure contract employees who may be unescorted or work
- 685 in sensitive areas are vetted by employers with the same standard and company employees
- 686 ○ Suitability (from a criminal background check and in keeping with human resources best
- 687 practices such as the whole person rule)
- 688 ○ Drug testing which is complicated by legalization trends
- 689 ● Ongoing Personnel Surety or Security
- 690 ○ Limit new employees, contractors or temporary employees in highly sensitive process areas
- 691 ○ Monitoring and supervision
- 692 ○ Confidential reporting and whistle blowing mechanisms
- 693 ○ Knowing who is and who should be on premises, and where they should be located, for
- 694 each shift keeping assignment information updated
- 695 ○ Establishing a system of positive identification and recognition that is appropriate to the
- 696 nature of the workforce (e.g., issuing uniforms, name tags, or photo identification badges
- 697 with individual control numbers, color coded by area of authorized access)
- 698 ○ Identifying staff that require unlimited access to all areas of the facility and limiting others
- 699 accordingly. Reassessing access privileges regularly.
- 700 ○ Limiting access so staff enter only those areas necessary for their job functions and only
- 701 during appropriate work hours (e.g., using electronic access control systems)
- 702 ○ Restricting the type of personal items allowed in non-public areas

703
704 Refer to the section entitled, “Change Management” for additional relevant information.

705 706 Security Awareness and Food Defense Training

707
708 Security awareness programs promote compliance with security policies and procedures which are intended
709 to guide individual and organizational behaviors and attitudes. Properly developed awareness programs
710 articulate management expectations, security guidance and provide information regarding where to go for
711 additional tools and training. Effective security awareness programs are part of on-boarding and retraining
712 processes and are regularly reviewed and updated. Key attributes of mature security awareness programs
713 include, but are not limited to the following:

- 714
- 715 ● Top-down management support and emphasis
- 716 ● Mechanisms for individuals to report security concerns/violations
- 717 ● Continuous review to maintain relevancy
- 718 ● Realistic training content which provides a clear picture of risks and responsibilities
- 719 ● Recurring training to keep security and food defense on top of mind with all key people

720
721 For the food and beverage facility, food defense training is a subset of the overall security awareness training
722 mission and a critical one. In every organization, leaders, security and food defense professionals must take
723 stock in the threats and resulting risks to the organization. Arguably, just because an organization produces a
724 food or beverage product, that organization is no less subject to workplace violence events. Therefore, when
725 mapping out the needs to elevate employee security and food defense awareness the training needs to be
726 comprehensive and thorough. Food and beverage manufacturers should not limit training to food defense
727 only and programs should include all these key attributes and include not only internal, but also external
728 guidance and best practices as supplied by reputable regulatory and academic institutions.

730 Food Defense Training Sources

731

732 There are several sources of food defense training, some of which are focused on the US based Intentional
733 Adulteration Rule.

734

735 • <https://www.fda.gov/food/food-defense-tools-educational-materials/food-defense-101-front-line-employee>

736 • <https://www.ifsh.iit.edu/fspca/courses/intentional-adulteration>

737

738
739 Some of the audiences that should be considered in any food defense program would include but in no way
740 be limited to:

741

742 • Senior facility leadership

743 • Food defense team

744 • Qualified individuals who will perform vulnerability assessments, write food defense plans and
745 steward the reanalysis and compliance maintenance

746 • Persons working at actionable process steps and the supervisors of those persons

747 • Persons dealing with contractors (to ensure contraband is not allowed in the facility)

748 • Persons managing visitors (to ensure that they are vetted and escorted)

749 • Persons handling chemicals and sanitation materials

750 • Persons interfacing with truck drivers in a receiving and shipping capacity

751

752 Additional guidance to establish and sustain effective security awareness programs can be found within ASIS
753 Standard ASIS SA-2020, Security Awareness, with the caveat that one needs to be a member of ASIS to
754 access this document.

755

756 Peer Monitoring

757

758 Concept of Natural Surveillance

759

760 Natural surveillance limits the opportunity for crime by taking steps to increase the perception that people
761 can be seen. Natural surveillance occurs by designing the placement of physical features, activities and people
762 in such a way as to maximize visibility and foster positive social interaction.

763 Natural surveillance includes the placement of windows and open areas with clear lines of sight. Natural
764 surveillance also refers to activities that have a relatively high number of people in the area for the designated
765 function or activity.

766

767 Security Integrity Assurance

768

769 Security Challenge Testing (Physical Penetration Test)

770

771 Food defense programs can undergo continuous improvement when individual mitigation strategies are
772 regularly verified. A common means to verify the effectiveness of your physical security program is called a
773 security challenge test (CT). An effective security challenge test program might include:

774

- 775
- Conducting regularly scheduled tests
- 776
- Sharing the results with the workforce to increase security awareness. For instance, if a challenge test
- 777
- results in a security breach, reminding employees of proper procedures to follow. In the event the
- 778
- challenge test does not result in a security breach a positive communication might be considered for
- 779
- the workforce celebrating the positive effort.
- 780
- If a challenge test results in a security breach, a facility might consider retraining and executing a
- 781
- similar test to assess whether the identified vulnerability has been resolved.
- 782
- A facility may also consider documenting the results of security challenge testing which may illustrate
- 783
- lessons from which other facilities in an enterprise may benefit.
- 784

785 When a security challenge test is conducted, it results in one of two outcomes; 1) Pass (security breach

786 attempt detected and proper response by person or system); or 2) Fail (security breach attempts not detected

787 and improper response by person or system).

788

789 Guidelines for executing tests:

790

- CT's might be conducted quarterly for plants and company headquarters.
- 792
- CT's might be conducted semi-annually for offices and DC's.
- 793
- Do not endanger the safety of individuals.
- 794
- Do not disrupt business or operations.
- 795
- Dependent upon the test scenario, consider informing local law enforcement that security challenge
- 796
- tests are taking place, especially if a test is carried out at night.
- 797
- Do not undertake any illegal activity.
- 798
- Do not record an actual incident / occurrence as a security challenge test. Observed unplanned
- 799
- events would be logged as security incidents or near misses.
- 800

801 Physical Security and Security Systems Maintenance, Inspection and Testing

802

803 Physical security measures should be regularly calibrated, maintained and tested. Recommendations for such

804 a program would include:

805

- Develop a master list of all systems to include calibration, maintained and testing required to include
- 807
- a frequency.
- 808
- Assign responsibility.
- 809
- Track.
- 810
- Create records to demonstrate what work has been done.
- 811

DRAFT

824 Appendix 2 – Visitor Management Terms, Conditions and Log

825

826 You are requesting entrance to a facility owned and/or operated by our company (“Company”). We welcome you but remind you that, in
827 consideration for your admission, you are agreeing to abide by our Company rules and the terms stated below which apply to any facility
828 owned and/or operated by Company or its affiliated companies or divisions.

829

830 **Respect for Company Procedures & Law** - You agree to comply with the Company's safety, security, environmental and health
831 procedures including, but not limited to: Standards of Business Conduct, Drug Free Workplace & Substance Abuse Policy and health &
832 safety policies while on the premises of any facility owned or operated by Company or its affiliated companies or divisions. Copies of our
833 policies are available upon request but, in general, visitors are expected to (i) respect our employees and our corporate property and assets,
834 (ii) conduct themselves and their business in a safe and courteous manner, and (iii) abide by applicable laws.

835

836 **No Photography or Recordings** - You understand that audio/visual recording or photography on any device (including cell phones)
837 is strictly prohibited unless express written permission is obtained from an authorized Company representative. This prohibition
838 applies not only within any Company facility but also to any meeting with Company representatives or to any Company equipment or
839 materials.

840

841 **Good Manufacturing Practices (GMP)** – By using this form, you are acknowledging that you have been provided, understand and
842 agree to abide by company operations, GMP and safety rules.

843

844 **Respect for Confidential Information** – You understand that this facility and the equipment and materials within it constitute
845 Company property and are of a private and proprietary nature. You agree that you will not, directly or indirectly, record, remove,
846 use or disclose to others any Company Confidential Information. "Company Confidential Information" means all information not
847 generally known to the public that you observe or receive in connection with any facility visit (including information communicated to
848 you in anticipation of, or as a follow-up to, your visit). Company Confidential Information specifically includes, but is not limited to,
849 all of the following: ideas, inventions, products, prototypes, designs, drawings, plant/facility layouts, manufacturing equipment,
850 processes and techniques, customer and supplier information, blue prints, distribution techniques and systems, pricing information,
851 formulations, ingredients, specifications, know-how, testing procedures and results, as well as advertising and marketing materials,
852 business plans, forecasts, budgets, costs and financial information and employee information.

853

854 **BY ENTERING OUR FACILITY, YOU AGREE TO FULLY COMPLY WITH THESE TERMS**
855 **AS ACKNOWLEDGED BY YOUR SIGNATURE BELOW.**
